English info

Offline questionnaire - instructions and limitations

A free, voluntary questionnaire for adults aged 18+. It helps organise experiences before a psychiatrist appointment. It does not diagnose conditions, recommend treatment or confirm that a person is mentally healthy. The complete questionnaire has not been clinically validated.

Download the questionnaire in your preferred language. Keep the HTML file you start with, your saved answers and the question reference downloaded from that same questionnaire together.

1. Open the downloaded HTML in a browser that supports local HTML files and JavaScript. Do not complete it in a Drive or messaging preview. If buttons do not work on your phone, try a compatible browser or a computer.
2. Read the introduction and select “Start / continue”. You can complete the questionnaire in sections and use the module selector to return to a topic. You can keep and reuse your lifetime history. Current symptoms, medicines and safety can change: before an appointment or sharing results, review the relevant answers and their timeframes. You do not need to start everything again; reopen the same HTML edition and your backup, then select the relevant module.
3. Choose an answer and press “Save & Next”. Selecting or typing alone does not save. “Skip question” records a skipped question and moves on; “Back” returns without saving a new choice.
4. In the medicines section, type one entry per current or relevant past medicine. Use “Add another medicine”. Include the name, actual dose/schedule, duration, reason, benefit and unwanted effects as far as you know. Copy from packaging or write “unknown”; do not guess. Supplements are not listed. The two blood-test questions ask only about testing and action on an identified deficiency.
5. Before a break, select “Save backup to continue (.json)”. To resume, reopen the same HTML edition and choose “Load backup file”. Loading replaces the current session. A backup contains saved answers only. Keep your original HTML: a new edition may not accept an older backup.
6. Select “Results / copy”. Download the answers TXT file or copy every numbered part from the same set of answers. Keep different people’s results separate. Skipped, hidden, unknown and unanswered questions are not negative answers.
7. Download the question reference (.md) from that results window and keep it with the answers. The readable doctor report can be printed or downloaded. Bring medicine packaging, an official medicine list and records when available so the clinician can verify your entries.
8. AI use is optional. “Open ChatGPT” opens https://chatgpt.com/ without sending anything. Use “Copy prompt” or “Copy prompt + answers”, then attach the matching question reference yourself. Ask for a factual summary and topics for your psychiatrist, not a diagnosis. Review earlier answers, especially current safety answers, before sharing.
9. Before another person uses the session, save the files you need and select “New questionnaire”. This does not delete downloaded or already shared files. Keep each person’s files separate.

Privacy and limitations

PRIVACY

The offline HTML has no analytics or automatic answer upload and does not send answers to Janis Paegle. Manually saved answers, including typed medicine details, may remain in browser storage. Files are not encrypted. Anyone with access to the device or backups may see them. Do not include unnecessary identifying information or other people’s medical details.

OPTIONAL CHATGPT LINK

The ChatGPT link opens an external AI service. Opening it contacts an external service; files and answers are not uploaded automatically. Upload support depends on the service and account. Read its privacy and retention terms before sharing health information. Do not upload another person’s results without permission.

TRANSLATION AND LIMITS

Translations were prepared using ChatGPT Plus and may contain wording, grammar or meaning errors. There has been no independent bilingual clinical review. Skip an unclear question rather than guess; a skip does not mean a symptom is absent. Medicine entries are your report, not a verified prescription record. Timing alone does not prove that a medicine caused a change. Reasoning and values questions cannot establish intelligence, capacity, narcissism, dangerousness or a victim identity.

MEDICAL AND LEGAL NOTICE

The questionnaire and AI do not replace a clinician’s interview or judgement. Do not change medicines or delay care because of these files or an AI response. Consult a doctor or psychiatrist if results worry you, or difficulties persist or affect daily life, even if AI reports no concerns. Nobody monitors answers or arranges help through this file. In immediate danger to life or safety, call 112 or your local emergency number; do not wait to finish or consult AI. This notice is not certification of medical or legal compliance and does not remove statutory rights or responsibilities.

AUTHORSHIP AND SOURCES

A free personal project by Janis Paegle, 2026, built with AI assistance. The author receives no income or other compensation from it. PHQ-9: Kroenke, Spitzer, Williams. GAD-7: Spitzer, Kroenke, Williams, Löwe. Source and adaptation details are in the question reference. Other sections are custom prompts, not substitutes for named diagnostic instruments. Third-party authors retain their rights; this guide grants no additional reproduction or translation licence.
